

Sequence Diagram: Creation And Construction

The Production Manager asks OrderCreator / ConcreteInputCreator (Factory Method) to create a production workflow. ProductionDirector then drives ItemManager / ConcreteItemManager (Builder) to configure the workflow and construct its internal structure. The ItemManager creates productionStages as an AggregateCollaborators (Composite) and creates individual stages such as assemblyStage and qualityStage as Collaborator leaves, adding them to the aggregate. Once the structure has been built, the completed production workflow is returned to the Production Manager.
